

Economic enhancements to your existing wired nurse call systems for achieving greater operational efficiency, higher safety standards, and an enhanced resident experience.

Today's standards for nurse call systems in senior living communities provide basic functionality such as dome lights, fixed call stations, an audio-visual alert panel at the Nurse's Station, and manual reset required at the device. Where these solutions often fall short is the ability to improve resident care and enhance their experience by leveraging actionable information from robust data capture and analysis. For example, better understanding your busiest times of day can help to support staffing strategies and improve response times. By integrating TruView™ software to your existing wired nurse call systems, sophisticated workflows are made simple. This economical solution includes real-time alerts delivered to workstations and mobile devices, customizable escalation paths, secure off-site system access, and the automatic documentation of response times, care time, and more.

Enable a data-driven approach to resident care and demand more from your wired nurse call system. CenTrak's TruView™ is designed specifically to meet the growing needs and requirements of Senior Communities, across all phases of care. With the integration of IoT technology, you will enhance response times to resident calls, your community's marketability, as well as staff, resident, and family relationships and satisfaction.

- Real-time alert notifications to staff anywhere on or off campus
- Configurable alert escalation paths and intuitive alarm management to shrink alarm fatigue and help focus attention to care
- Robust data capture and reporting via desktop software and mobile applications
- Actionable analytics to benchmark current performance and measure improved efficiency
- Real-time automation of staff and resident changes via data integration with other community systems (EHR, Active Directory, etc.)
- Single system and modern user interface to manage community alarming events across all building systems (nurse call, fall detection pressure pads, smoke detectors, etc.)
- Interactive campus maps to immediately view where active alarms are occurring
- A dedicated CenTrak Customer Experience Engineer offers practical guidance to help you face pressing challenges, support change, and sustain results
- Scalable real-time location system (RTLS) platform that can also enable indoor/outdoor wireless emergency call, wander management, contact tracing, and asset tracking
